Title of the Working Group: Mountain Hydrology

Abstract of the proposed research activity

Mountains are water towers for sustaining Earth's fresh water systems through snow, ice and lake storages, permafrost and groundwater recharge. Hydrological processes in mountainous regions are complex and heterogeneous and our understanding of them is restricted due to limited data. In regions with extensive glacier and snow cover, the hydrological regime is highly susceptible to climate change and the effects go beyond the mountain systems. This WG is linked to the Research Theme – Mountain Hydrology. It will include, but not be limited to the following topics:

- Effects of climate change on hydrological regimes;
- Extreme events (floods and droughts) in mountain regions;
- Impacts of water availability on human uses of water;
- Impacts of water availability on ecosystems.

Panta Rhei Research Themes, Targets and Science Questions addressed by the Working Group

This WG is linked to the Research Theme – Mountain Hydrology. The science questions proposed in the research theme are:

- How can we best combine in-situ and remote sensing information for improving quality and quantity of observation data in mountainous regions?
- What are the gaps and shortcomings in currently available hydrological models designed to cover large regions? Such models should adequately represent required details of the physical processes and also be computationally efficient.
- How can we improve the understanding of climate change in mountainous regions?
- How does climate change impact the sensitivity of mountainous eco-systems and hydrological responses?
- What are the key sources of predictive uncertainty in the assessment of climate change impacts and what is the best way to interpret the impacts under uncertainty?
- How will changes in hydrological regimes influence the impacts of water-related disasters and how will they affect the multiple uses to which water is put?

Societal impact of the Working Group activity

Mountainous regions host diverse human activities, eco-systems, biodiversity and cultural heritage, which are inextricably linked to climate and hydrological regimes. Economic developments in mountainous regions are largely water-based, e.g. agriculture and hydropower. Climate change has increased the vulnerability of mountain societies and eco-systems to the impacts of natural disasters including floods, droughts, landslides and mudflows. Socio-economic developments may also be adversely impacted. By improving the understanding of the links between climate change, hydrology and eco-systems, hydrologists can contribute to shaping sustainable development strategies and adaptation measures for mountain societies and for downstream societies influenced by mountain waters.

List of Participants

This is an initial list of individuals who have indicated interests to participate in the WG. We (Prof. G. Young and Dr. S. Maskey) are working on to finalize the list soon. Topics will be reviewed and refined once the WG membership is more final.

Name	Institute	Area of Expertise	email
David M. Hannah (Chair)	University of Birmingham	Hydroclimatology and ecohydrology	d.m.hannah@bham.ac.uk
Gordon Young	Canadian Geophysical Union	Mountain hydrology	gordonyoung_wwap@yahoo.com
Shreedhar Maskey	UNESCO-IHE, Delft, The Netherlands	Hydrological Modelling, Climate Change	s.maskey@unesco-ihe.org
Pierre Chevallier	CNRS, IRD, Universités Montpellier 1&2	Surface flow analysis and modelling	pierre.chevallier@ird.fr
Z. (Bob) Su	ITC, University of Twente, Netherlands	Hydrology, Energy Balance	z.su@utwente.nl
Yangbo Chen	Sun Yat-sen University, Guangzhou, China	Remote sensing; Modelling	eescyb@mail.sysu.edu.cn
Wouter Buytaert	Imperial College, London	Water resources and environmental change, sustainable development	w.buytaert@imperial.ac.uk
Per Stalnacke	Bioforsk, Norway	Agricultural hydrology, water quality	per.stalnacke@bioforsk.no
Elango Lakshmanan	Anna University, Chennai, India	Groundwater hydrology	elango34@hotmail.com
Maria Jose Polo	Universidad de Córdoba, Spain	Snow modelling, remote sensing	mjpolo@uco.es
Harald Kunstmann	Karlsruhe Institute of Technology, Campus Alpin	Hydrometeorology	harald.kunstmann@kit.edu
Ulrich Strasser	University of Innsbruck	Alpine Hydroclimatology, snow modelling, Human-Environment Systems	ulrich.strasser@uibk.ac.at
Brian Menounos	University of Northern British Columbia	Glaciers	Brian.Menounos@unbc.ca
Brighid O'Dochartaigh	British Geological Survey	Groundwater	beod@bgs.ac.uk
Arun Shrestha	ICIMOD, Nepal	Climate change and impact; precipitation monitoring	abshrestha@icimod.org
Valentin Golosov	Moscow State University, Russia	Sediments	gollossov@rambler.ru
Paolo Porto	University Mediterranea	Sediments	Paolo.porto@unirc.it

	of Reggio Calabria,Italy		
Hayley Fowler	Newcastle, UK	Climate Change impacts	Hayley.fowler@newcastle.ac.uk
Francesca Pellicciotti	ETH Zuerich	Snow and ice melt modelling	pellicciotti@ifu.baug.ethz.ch
