

My Journey through the IAHS Assembly 2022, Montpellier, France.

First and foremost I would like to convey my greatest thanks to SYSTA and the respective personnel who saw the potential in me as a young scientist and provided me with this incredible opportunity to participate in the International Association of Hydrological Science (IAHS/AISH) Assembly.

Attending the assembly provided me with a great opportunity to spend time with a group of intelligent, passionate and accomplished women in hydrology. The professionals and speakers were approachable and made it easy for us young scientists to engage with them. It was very interesting to learn about hydrological challenges and novel approaches that are being applied in other semi-arid regions to overcome these challenges and provide new and improved knowledge on catchment hydrological processes under various spatial and time scales. The sessions were long enough to allow time for knowledge exchange, but not too long to get boring which was exciting. The feedback received during the poster sessions was very helpful as I will also apply these notes to my thesis corrections. I was also able to create connections and discussed possible collaborations with other researchers from countries such as Tunisia, Spain and Morocco. I also benefitted a lot from other sessions such as S4 and S17, the knowledge I will be applying in my Postdoctoral work.

Greatest thanks to SYSTA.

Abstract: [Spatial and temporal variations in baseflow across headwater streams in the Jonkershoek valley, South Africa.](#)

Session S21: [Hydrology of Mediterranean and semi-arid regions](#)
