NO_3NO_2

optical sensor

Questions

Two questions we are interested in:

- *How do the NO_3NO_2 measurements from grab sampling compare to those from optical technology under different ambient conditions?*
- *What factors are at play for a possible discrepancy in NO_3NO_2 measurements between the two methods?*

Objectives

Straightforward:

- Gather grab sample measurements from another study and compare the NO_3NO_2 measurements with the USGS optical sensor measurements
- Analyze their relation with ambient variables .

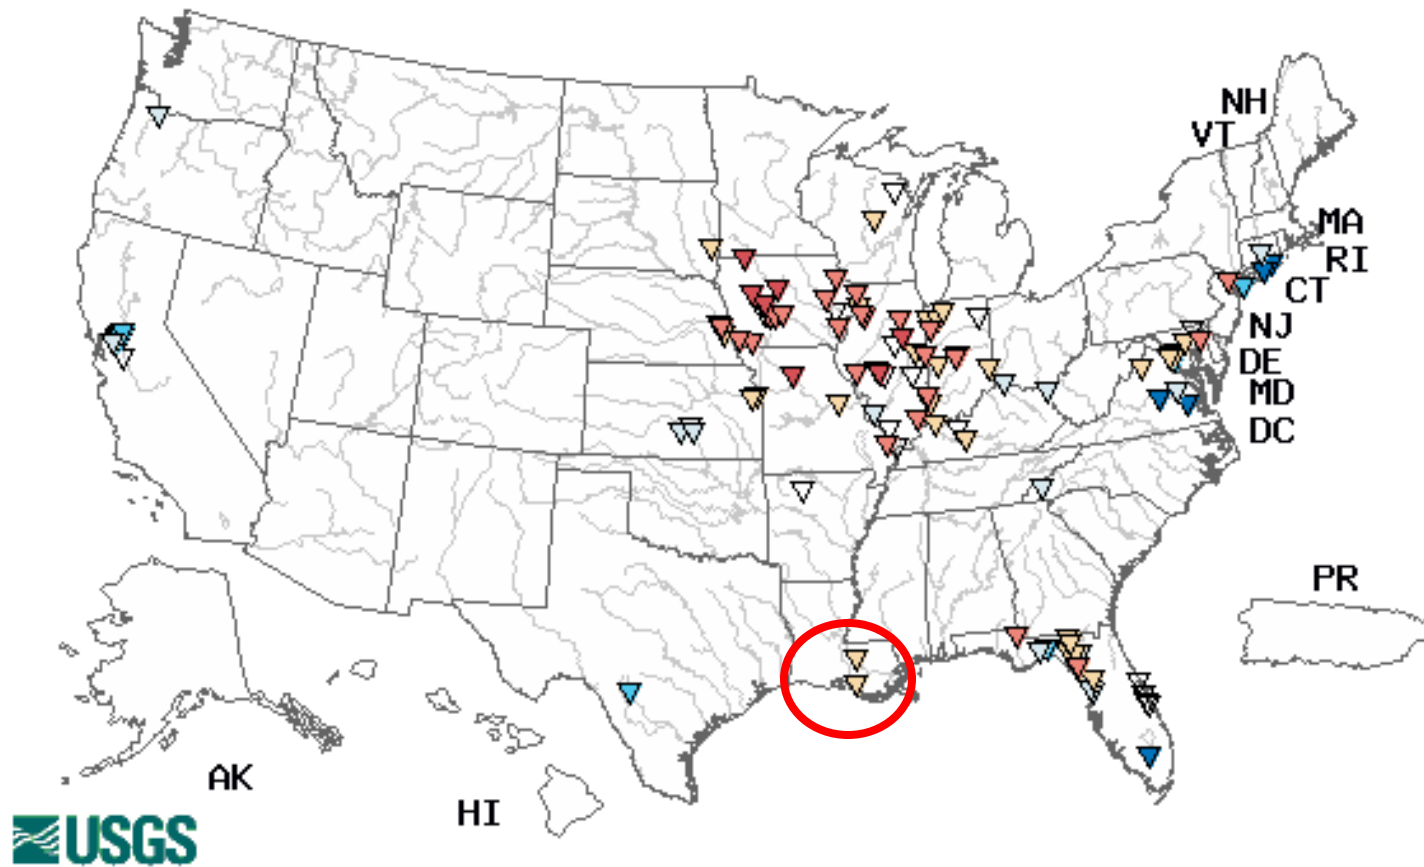

Outline

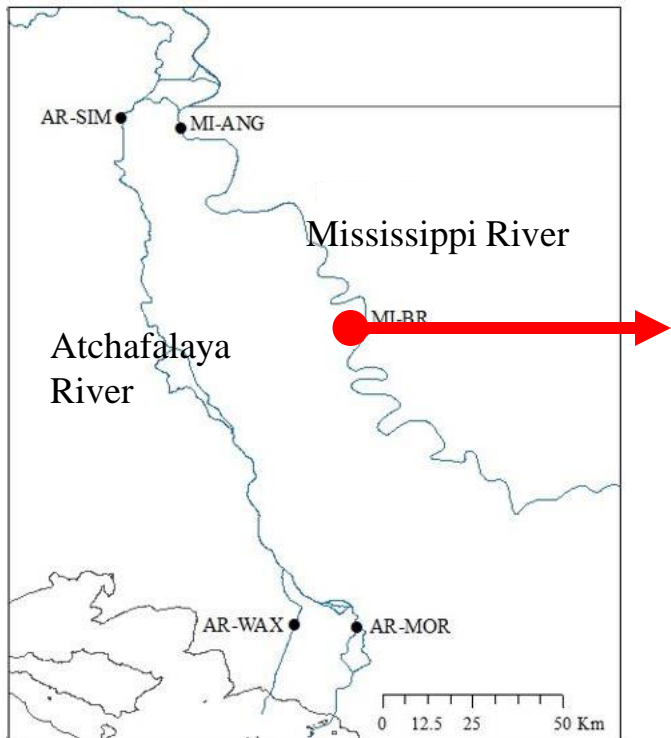

- ❑ Study sites & instrumentation
- ❑ Ambient & laboratory measurements
- ❑ Results and discussion
- ❑ Closing remarks

Study Sites & Instrumentation

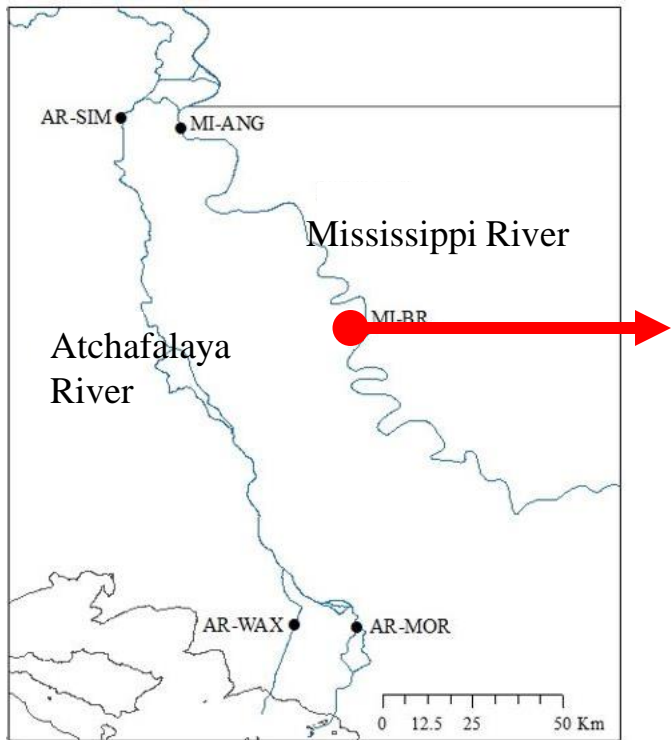

Study Sites & Instrumentation

Channel width:	920 – 990 m
Thalweg:	20 – 22 m
Avg. discharge:	15,404 m ³ s ⁻¹

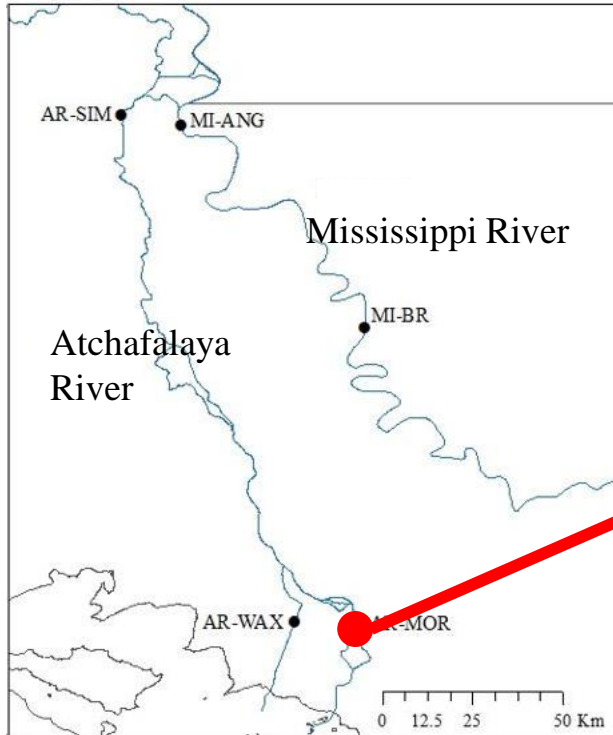

Study Sites & Instrumentation

Satlantic, SUNA V1 10 mm path

Study Sites & Instrumentation

Channel width:	540 – 560 m
Thalweg:	15 – 16 m
Avg. discharge:	$3,515 \text{ m}^3 \text{ s}^{-1}$

Study Sites & Instrumentation

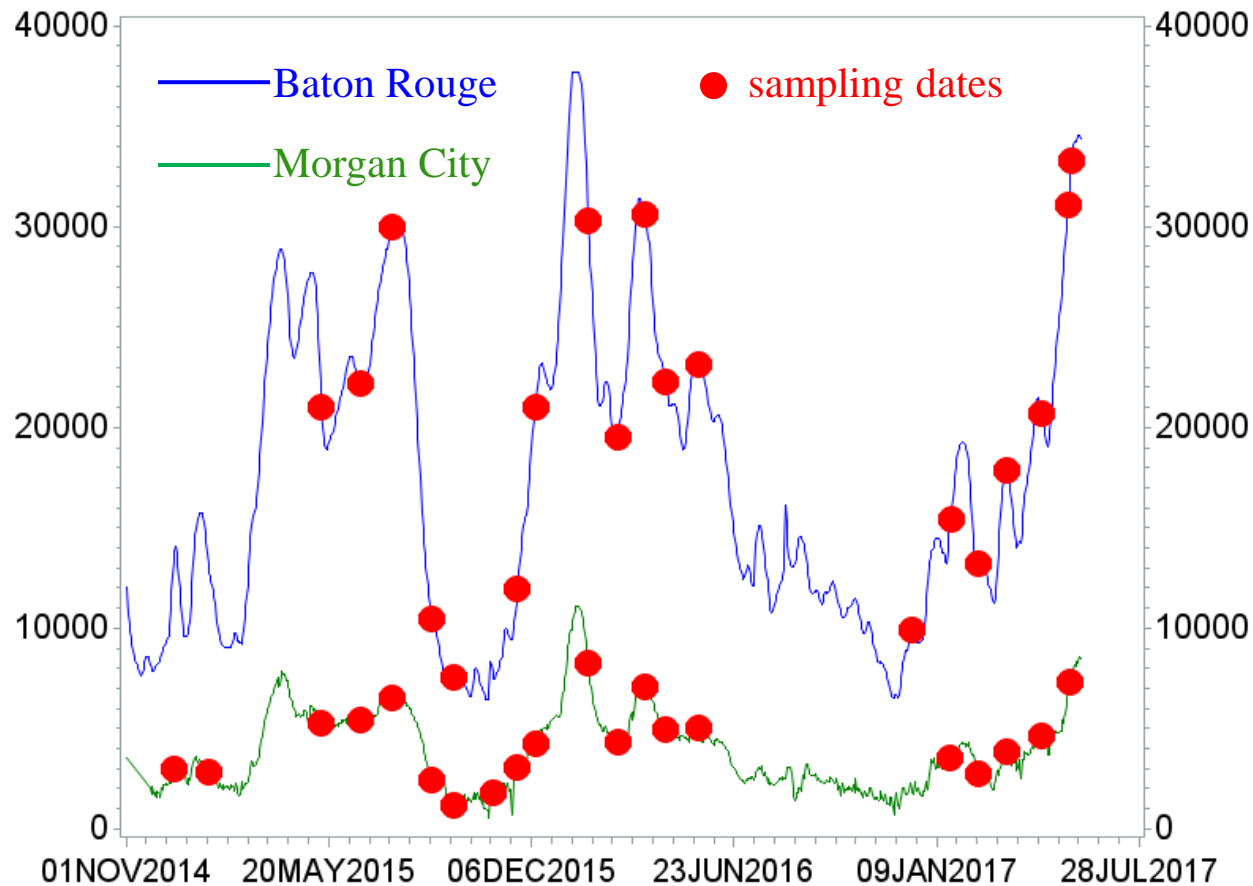

Satlantic, SUNA V2 5 mm path

Ambient Measurements

Discharge ($\text{m}^3 \text{s}^{-1}$)

Ambient conditions

Turbidity: 21-175 NTU

DO: 3.7 – 11.8 mg/L

DOC: 3.2 – 11.1 mg/L

Temp: 5.7 – 30.2 °C

pH: 6.9 – 8.1

Ambient Measurements

Parameters:

- Turbidity
- Dissolved oxygen
- Specific conductivity
- Temperature
- *pH*

Laboratory Analysis

Parameters:

- Nitrate & Nitrite
- DOC
- DIC
- TKN
- Phosphate
- Total P
- BOD
- Metals (dissolved/total)
-

Photochemical transformations of CDOM?

Source: Xu 2009

Closing Remarks

- Optical measurements were consistently higher than grab sample measurements, especial in the lower range of laboratory measurements. It is possible that the river chemistry is not well-mixed.
- The discrepancy in NO_3NO_2 measurement between the optical and grab sample methods had no relation with ambient variables, except for a weak relation with DO and pH.
- The findings indicate a possible influence of photosynthetic activities on optical NO_3NO_2 measurements, which could be tested with high-resolution measurements on dissolved carbon dioxide, chlorophyll *a*, and colored dissolved organic matter.
